

# Important – About

# GitLab

- Always create/edit/delete your lab task files in your [local repo](#), then, once tested, `git add/commit/push` your changes (changed lab task files) to your Git repo
- Do not work on your lab task files in your [Git repo](#) via the GitLab web interface
  - [Do not create/delete files](#) using this web interface
  - [Do not edit files](#) using this web interface
  - Why?
    - Because your GitLab repo will have a “newer” date (file modification date) than your local repo and this will cause problems when you try to push files from your local repo to your GitLab repo
- Use the GitLab web interface only to confirm that your pushes have been successful – nothing else!
